When you think about the things you need for work or school, you probably don't think of it as a programming language. But for graphic designers and web developers, Photoshop is one of the most important parts of their everyday work. Installing Adobe Photoshop is relatively easy and can be done in a few simple steps. First, go to Adobe's website and select the version of Photoshop that you want to install. Once you have the download, open the file and follow the on-screen instructions. Prior to CS4, as I learned from someone at the Adobe Senior leadership team for the time, you might get away with setting these options in the Preferences dialog by specifying "All" when you picked the "Edit" option. I mentioned that Lightroom has more than just optimized RAW conversion

and culling tools. It now comes with a slew of more advanced editing tools, such as Radial Filters and Spot Removal, Clone Stamp and many others, all coming directly from Photoshop. This group of tools gives you access to 16-channel HDR images, VSTS filters, Exposure Adjustment Layers that adjust individual colors in your image or even the HDR channel itself. Adobe wrote a dedicated tutorial explaining how to use every tool in this group, while also showing you how to use filters in Photoshop, which makes for a very useful workflow. Out of the box, Lightroom comes with a few advanced editing tools, such as Radial Filters and Spot Removal, Clone Stamp, Healing Brush, Face-Saving, and Bump Map. Customization Shortcuts: Adobe Photoshop is designed very much around the idea that, all too often, you have to spend a good period of time customizing your settings before you can really do anything productive with your images. This obviously creates a vicious cycle: you have to spend a lot of time learning everything in Photoshop, then you have to build your own presets to speed you through the learning process, then you spend even more time learning the new settings and creating new presets, etc., etc., etc. This mad, slow-motion cycle will almost always mean that you're going to have to spend more time adapting your workflow to meet the needs of your favorite software than you would if you had a different workflow to begin with.

Rudy Smits (who was working at the time for Philips Digital Media Solutions in the Netherlands) was frustrated with the timing of timecode data in a movie. Timecode data in movies is recorded by the camera and then separated from the movie, sent to a conversion facility and then re-combined with video and sound, adding some extra time here and there. He

used to need to download these files, find them, and then use an editor like Premiere Pro or After Effects to edit out the timecode, and then find the timecode again in each of the files.Smits launched his project in prototype form as a website, where visitors could use Flash to watch a movie, track the timecode and see it in the interface, with an option to export the movie to a.swf file to share it with colleagues. e3d0a04c9c
