I wanted to take a look at Lightroom one more time before I made the plunge to the 5.2 version. However, I'm not sure what I'm looking for..... Lightroom's "Performance Issues" section in the previous review really did help me find these. There were some of these I had not encountered before. I and I'm pretty sure everyone who is reviewing this digest already had encountered these. Hi Peter!

I see your comment in the Lightroom forum as well. The performance issues you experienced (even in Developer Mode) might have been due to the fact that you were updating from an old Lightroom 4.5.x (or 4.x) install. In my 32-bit instance of Lightroom 5, Developer Mode is always performed in RAM. Even while doing large image catalogs with many images on disk. However, if you already had 30++ images in a catalog and then upgraded to Lightroom 5.2, regardless of whether it was installed as 32-bit or 64-bit, the performance issues would be more likely related to the underlying storage layers. Accordingly, performance will always be impacted. Since you are concerned with what might happen in a 64-bit environment, you may want to check first if Lightroom 5.2 has performance issues on your system, by trying it in a 32-bit mode, before making a final purchase decision. You also may want to check out my Adobe Creative Cloud Core vs Extended article to see if the Basic version of Lightroom is still sufficient for your needs. If the upgrade does fix your performance issues and it does still meet your needs, then you can upgrade.
